

BOBOLINK

The Bobolink has one of the most incredible migrations of any songbird, traveling up to 12,500 miles (20,000 kilometers) annually.

With the distance it travels over the course of its life, a typical Bobolink travels a distance equivalent to circling the globe five times.

How can you help?

Populations have declined nearly 75% since 1966 due in part to loss of open meadow and grassland habitats.

To help populations near you, maintain open fields by mowing once in late summer.

Marshes, grasslands, and agricultural fields in Venezuela and Colombia are important spring and fall stopover sites for large flocks of Bobolinks.
