

BLACK-THROATED BLUE WARBLER

The Black-throated Blue Warbler breeds in mature northern forests. During migration to and from their Caribbean wintering grounds, they can be seen flitting through the vegetation in a variety of habitats, including parks and gardens.

During migration and at the wintering grounds, the sexes use slightly different habitats: males use coastal and mid-elevation forests whereas females use higher-elevation dry forest habitats.

How can you help?

Black-throated Blue Warblers can fall prey to free-roaming outdoor cats. To protect this species and other migratory birds in your community, be sure to keep cats leashed, indoors, or restrict their outdoor access

KEEP CATS INDOORS

Extensive settlement and deforestation over the last 300 years have taken a toll on this warbler. As farming practices have decreased in recent decades and fields have returned to forests, their numbers have increased.
